Contact information: RXNAVINFO@LIST.NIH.GOV

#### Motivation

Drug classes constitute important information about the drugs and are critical to important use cases, such as clinical decision support (e.g., for allergy checking). *RxNav*, our RxNorm browser, already displays the classes for RxNorm drugs, but its drug-centric perspective does not accommodate the exploration of drug classes. This is the reason why we developed a web-based companion browser, *RxClass*, which supports navigation between RxNorm drugs and drug classes from several sources, including ATC, MeSH, NDF-RT and Structured Product Labels from the Food and Drug Administration (FDA).

#### **Drug Class Sources**

The Anatomical Therapeutic Chemical drug classification (*ATC*) is a resource developed for pharmacoepidemiology purposes by the World Health Organization Collaborating Centre for Drug Statistics Methodology.

The Medical Subject Headings (*MeSH*), developed by the National Library of Medicine (NLM), provides a rich description of pharmacological actions for the purpose of indexing and retrieval of biomedical articles.

The National Drug File-Reference Terminology (*NDF-RT*), developed by the Department of Veterans Affairs, provides clinical information about drugs (therapeutic intent, mechanism of action, etc.) and integrates drug classes from FDA's Structured Product Labels.

## **Linking RxNorm Drugs to Drug Classes**

Like *RxNav*, *RxClass* is supported by functions from an application programming interface (API), which can be used independently for integrating drug class information in programs. The API serves the latest information available from the drug information sources.

RxClass provides a graphical interface to explore the hierarchical class structures of each source and examine the corresponding RxNorm drug members for each class. Some features of RxClass:

- The user can navigate through the drug classes via the hierarchical menu, or use the search feature to identify a drug class or RxNorm drug.
- Drug class member results can be saved to a file in several different formats.
- Users of RxNav can link to RxClass to get class members.

A sample screenshot of RxClass is shown in Figure 1.

### Conclusions

Providing drug class members has long been a missing piece of information in *RxNav*. With *RxClass*, we now provide a link between drug classes from various sources and *RxNorm* drugs.

RxClass is available from the main RxNav website (<a href="http://rxnav.nlm.nih.gov">http://rxnav.nlm.nih.gov</a>), along with additional information about RxNav and our APIs to various drug information sources.
